Bridging Textual and Tabular Data for Cross-Domain Text-to-SQL Semantic Parsing

Paul G. Allen School of Computer Science and Engineering

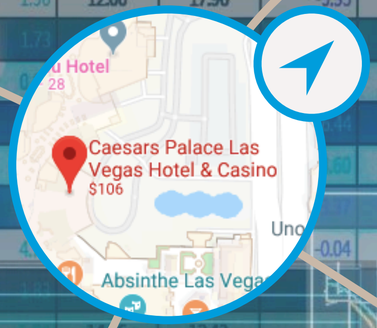
Ph.D. Qualification Exam - Winter'21

Advisors: Luke Zettlemoyer and Yejin Choi

Victoria Lin

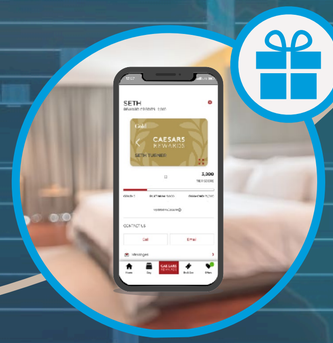
Work done at Salesforce AI Research

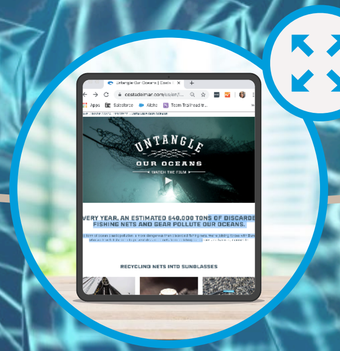
Intelligent



Personal

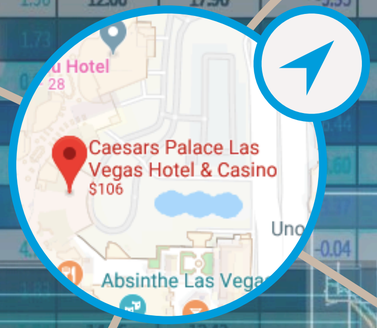
Conversational



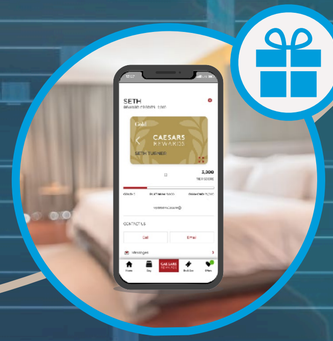


Tables and **databases** are commonly used data structures that power a variety of downstream applications.

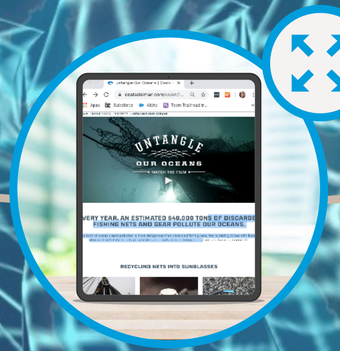
Intelligent



Personal



Conversational



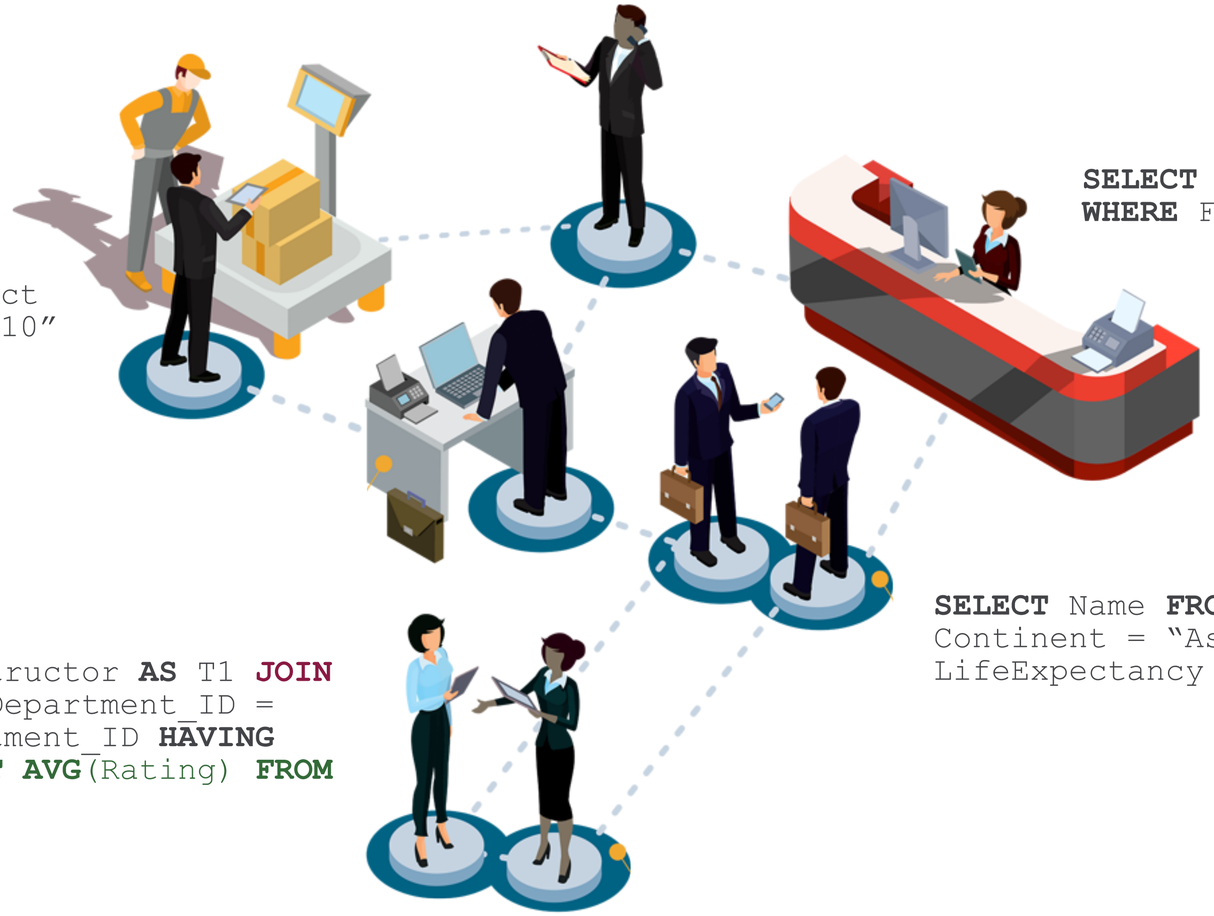
The **Internet** contains billions of public tables. And more tabular data can be found on **corporate intranets** and **personal devices**.

Natural Language Interface to Databases

Traditionally, users access databases using **structured query language (SQL)**.

Natural Language Interface to Databases

Traditionally, users access databases using **structured query language (SQL)**.



```
SELECT Quantity FROM Product
WHERE Name = "Hoverboard x10"
```

```
SELECT Arriving_Time FROM Flights
WHERE Flight_Number = "CZ327"
```

```
SELECT T2.name FROM Instructor AS T1 JOIN
Department AS T2 ON T1.Department_ID =
T2.ID GROUP BY T1.Department_ID HAVING
AVG(T1.Rating) > (SELECT AVG(Rating) FROM
Instructor)
```

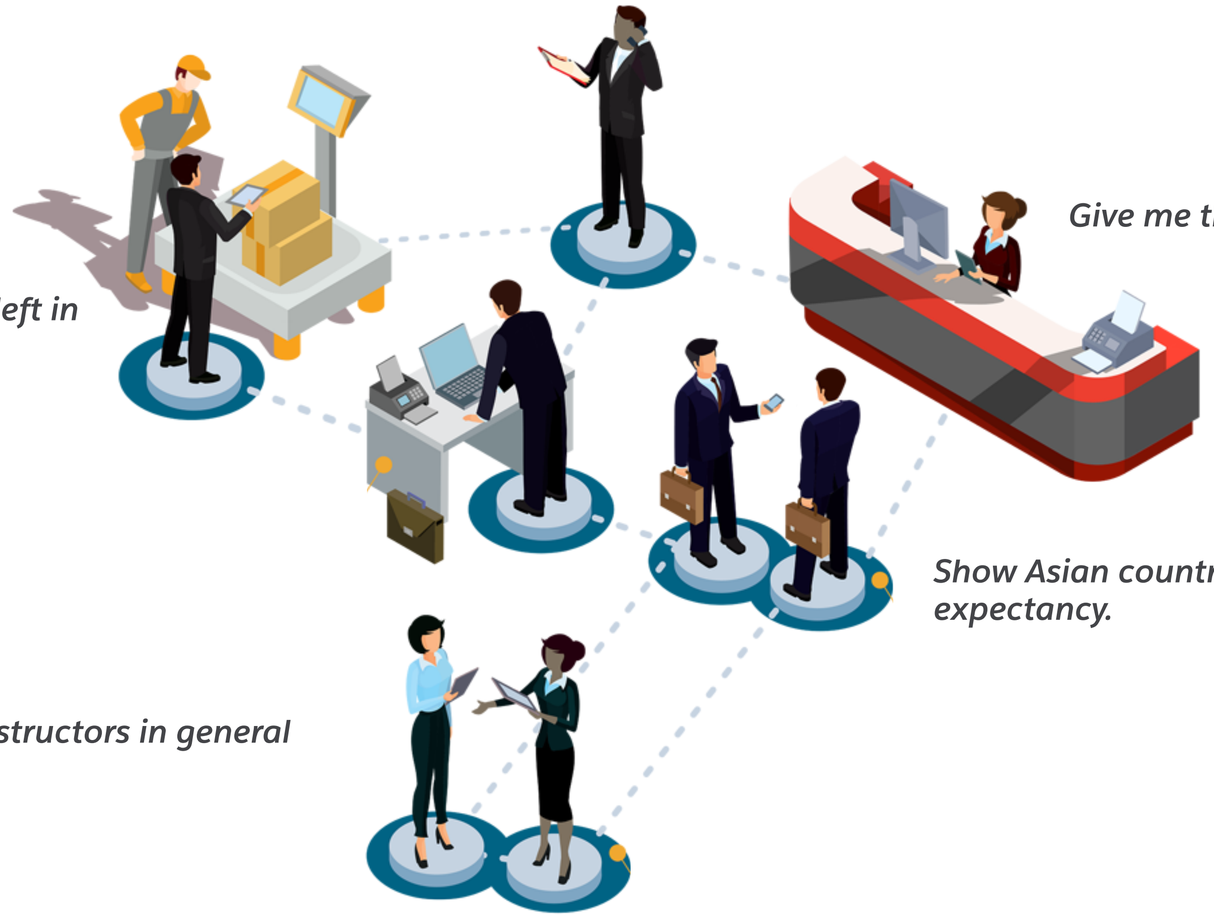
```
SELECT Name FROM Country WHERE
Continent = "Asia" ORDER BY
LifeExpectancy LIMIT 1
```

Natural Language Interface to Databases

Our goal is to learn semantic parsers that map natural language utterances to **executable** SQL queries for **any database.**

Natural Language Interface to Databases

Our goal is to learn semantic parsers that map natural language utterances to **executable** SQL queries for **any database.**



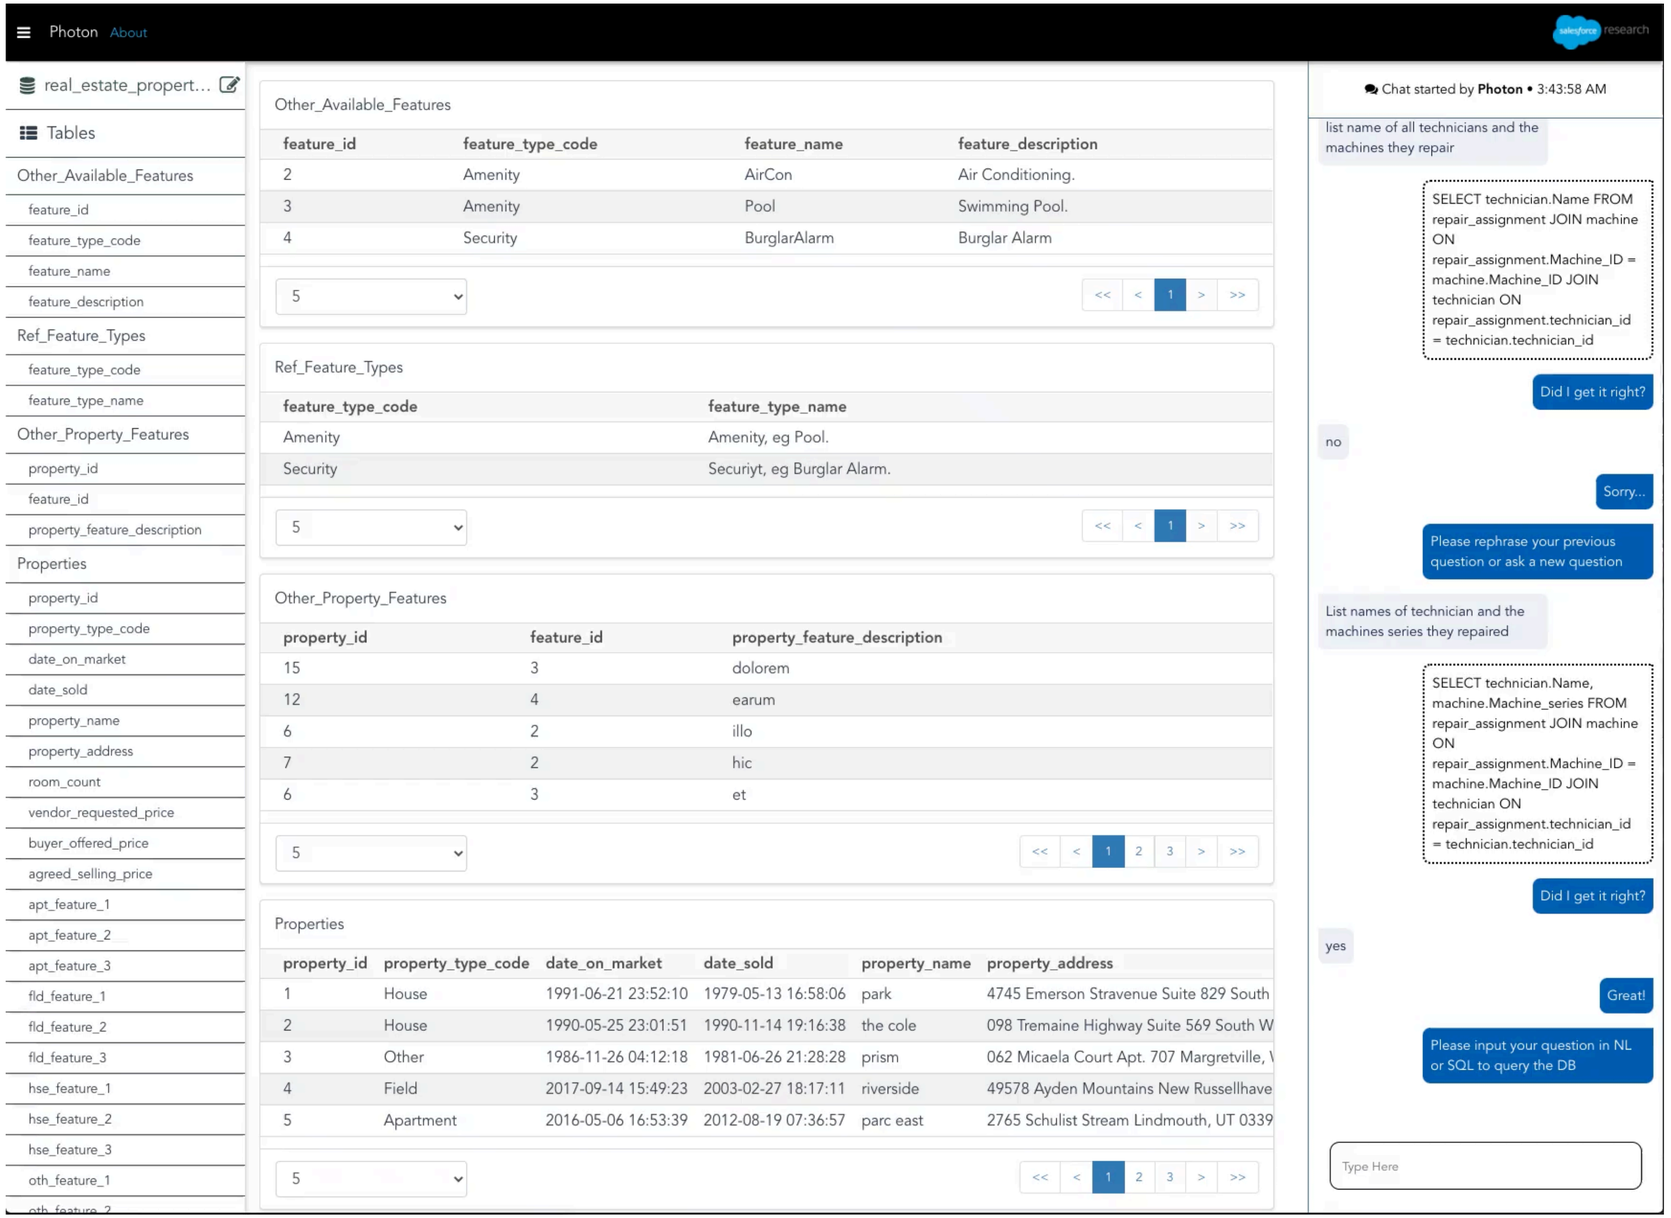
How many "Hoverboard x10" are left in stock?

Give me the arriving time of "CZ327".

Show Asian countries ordered by life expectancy.

Which departments have instructors in general rated above average?

salesforce research https://naturalsql.com



Text-to-SQL translation

Query arbitrary subsets of tables in any database

Support table join and other complex SQL operators

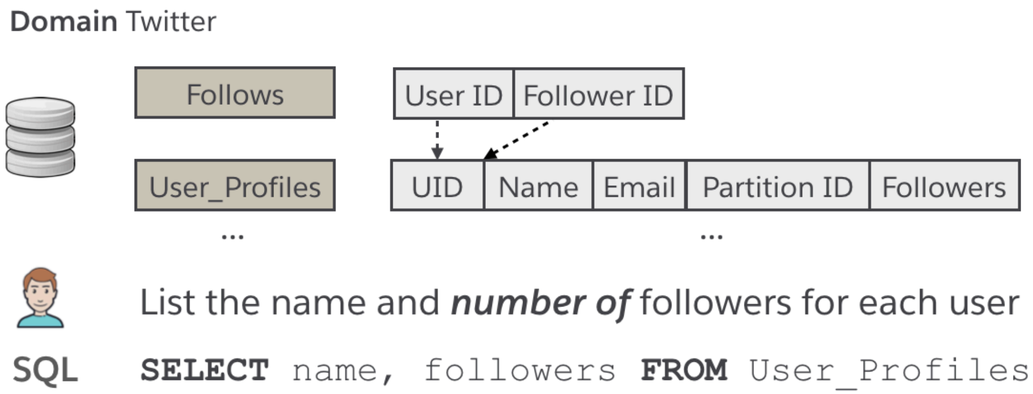
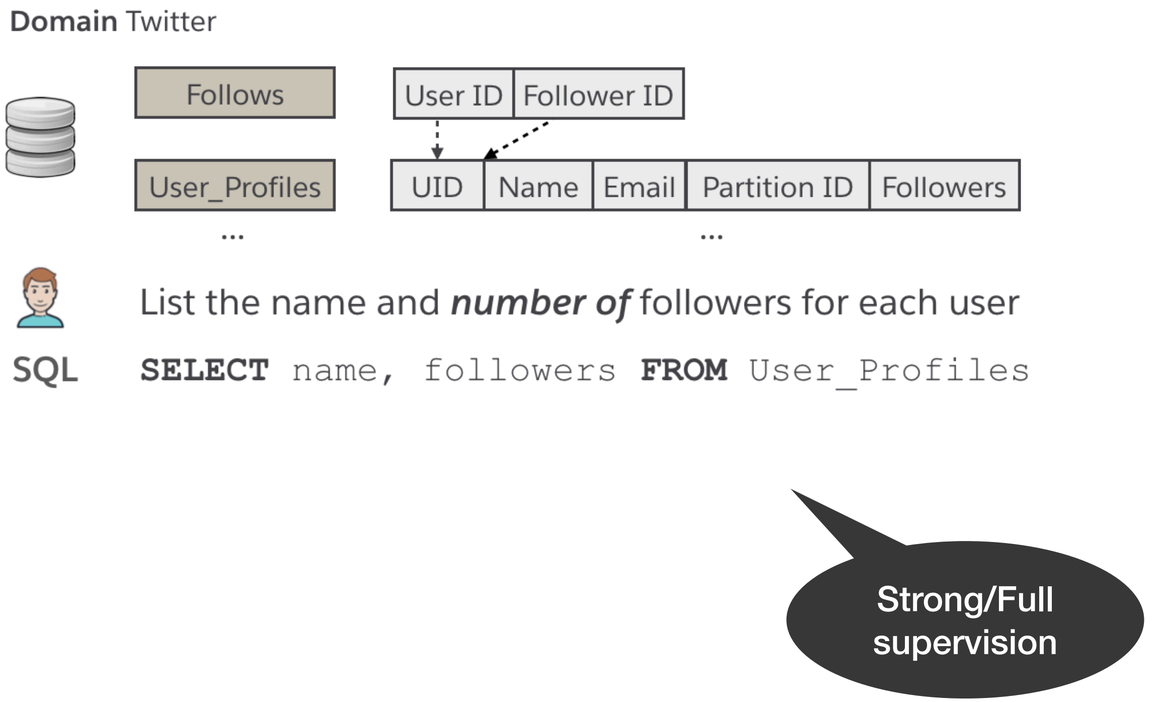
Foreign Key

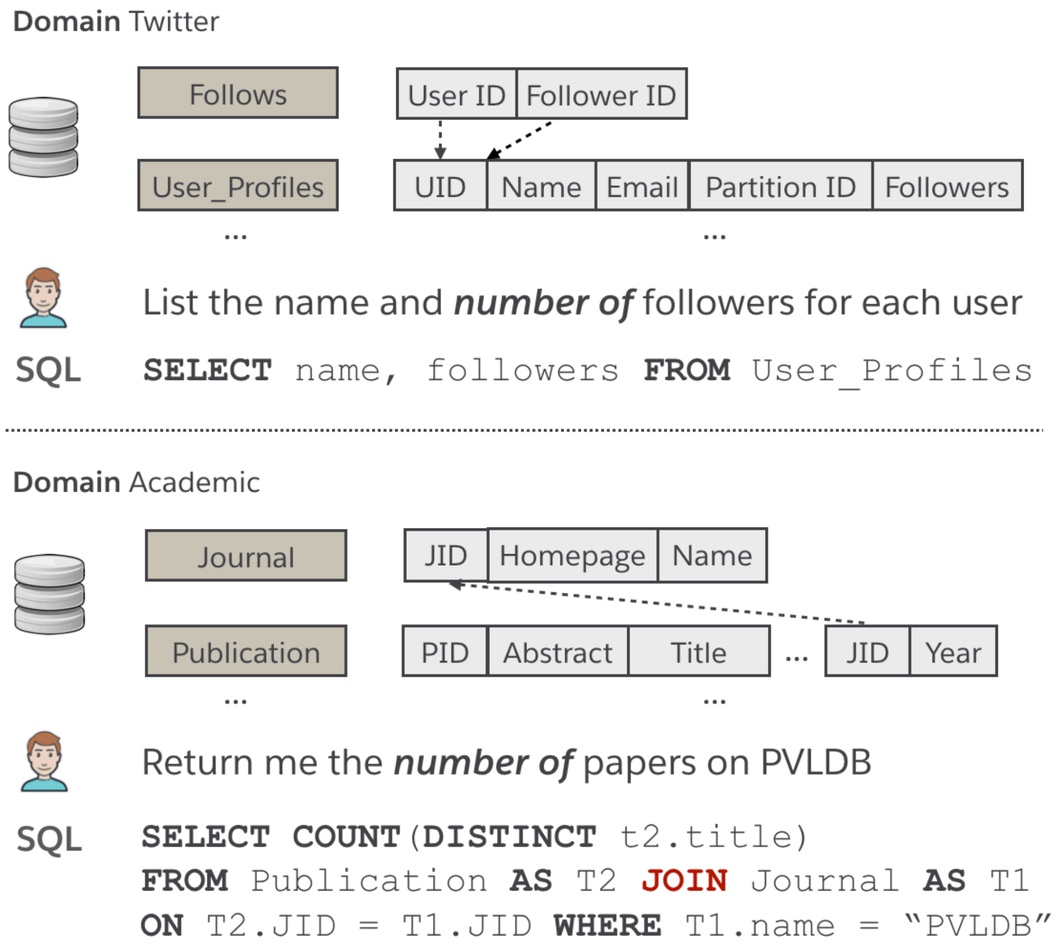
Text-to-SQL Semantic Parsing



Text-to-SQL Semantic Parsing



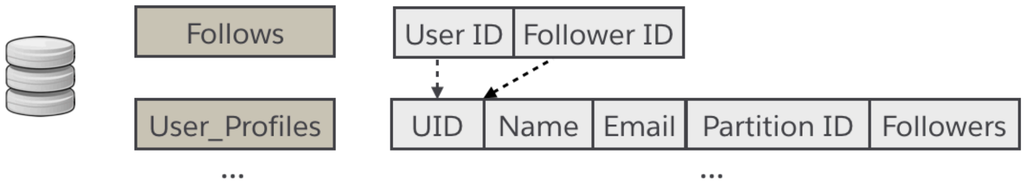
Cross Domain Text-to-SQL Semantic Parsing



Challenges

Challenge 1: Questions with similar intent may map to very different SQL logical forms when issued to different DBs.

Domain Twitter



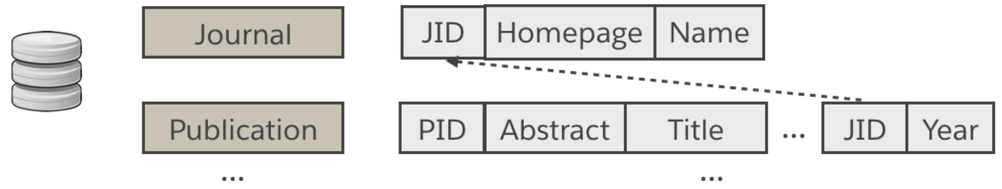
List the name and ***number of*** followers for each user

SQL

```
SELECT name, followers FROM User_Profiles
```

Cross-Database

Domain Academic



Return me the ***number of*** papers on PVLDB

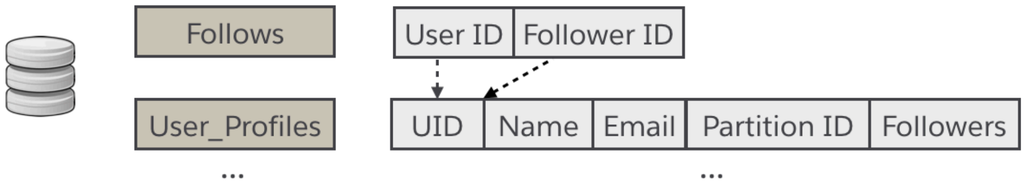
SQL

```
SELECT COUNT(DISTINCT t2.title)
FROM Publication AS T2 JOIN Journal AS T1
ON T2.JID = T1.JID WHERE T1.name = "PVLDB"
```

Challenges

Challenge 2: Domain-specific entities are frequently encountered.

Domain Twitter

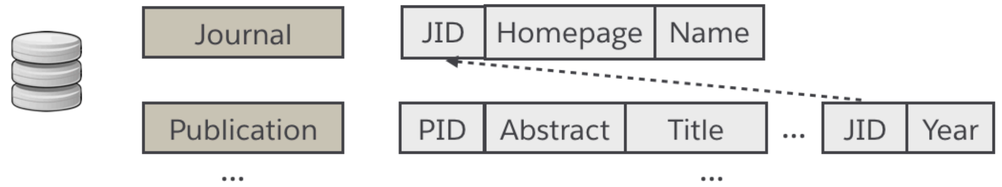


List the name and ***number of*** followers for each user

SQL

```
SELECT name, followers FROM User_Profiles
```

Domain Academic



Return me the ***number of*** papers on PVLDB

SQL

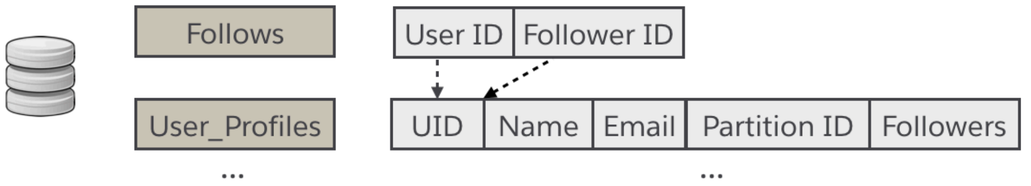
```
SELECT COUNT(DISTINCT t2.title)
FROM Publication AS T2 JOIN Journal AS T1
ON T2.JID = T1.JID WHERE T1.name = "PVLDB"
```

Domain Diversity

Observations

Observation 1: It is important to contextualize the question and the database (DB), similar to the setup in machine reading comprehension

Domain Twitter

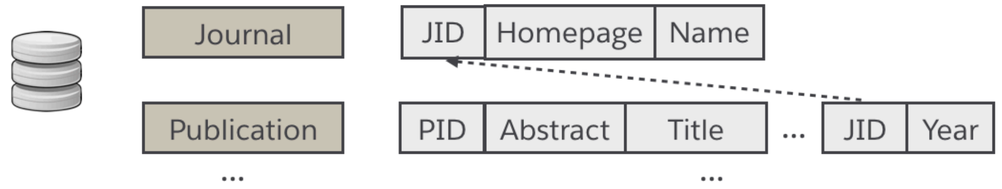


List the name and ***number of*** followers for each user

SQL

```
SELECT name, followers FROM User_Profiles
```

Domain Academic



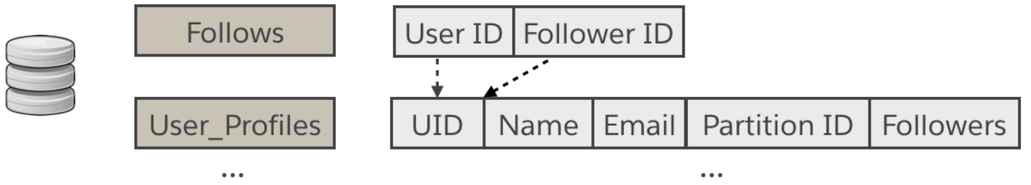
Return me the ***number of*** papers on PVLDB

SQL

```
SELECT COUNT(DISTINCT t2.title)
FROM Publication AS T2 JOIN Journal AS T1
ON T2.JID = T1.JID WHERE T1.name = "PVLDB"
```

Observations

Domain Twitter

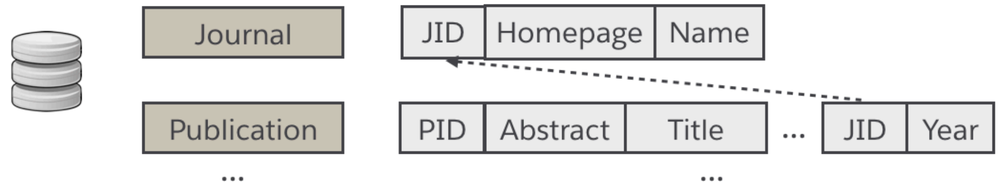


List the name and ***number of*** followers for each user

SQL

```
SELECT name, followers FROM User_Profiles
```

Domain Academic



Return me the ***number of*** papers on PVLDB

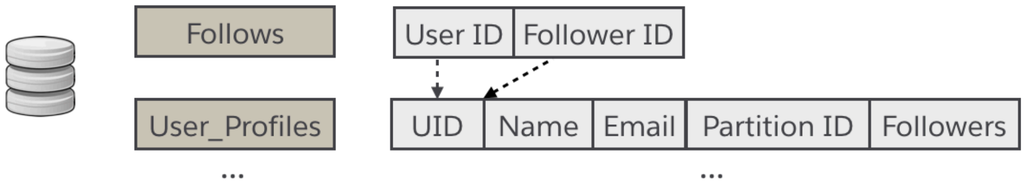
SQL

```
SELECT COUNT(DISTINCT t2.title)
FROM Publication AS T2 JOIN Journal AS T1
ON T2.JID = T1.JID WHERE T1.name = "PVLDB"
```

Observation 2: Database understanding should take into account both the DB schema and the DB content

Observations

Domain Twitter

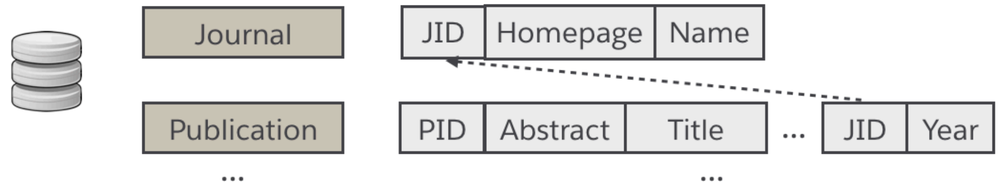


List the name and ***number of*** followers for each user

SQL

```
SELECT name, followers FROM User_Profiles
```

Domain Academic



Return me the ***number of*** papers on PVLDB

SQL

```
SELECT COUNT(DISTINCT t2.title)
FROM Publication AS T2 JOIN Journal AS T1
ON T2.JID = T1.JID WHERE T1.name = "PVLDB"
```

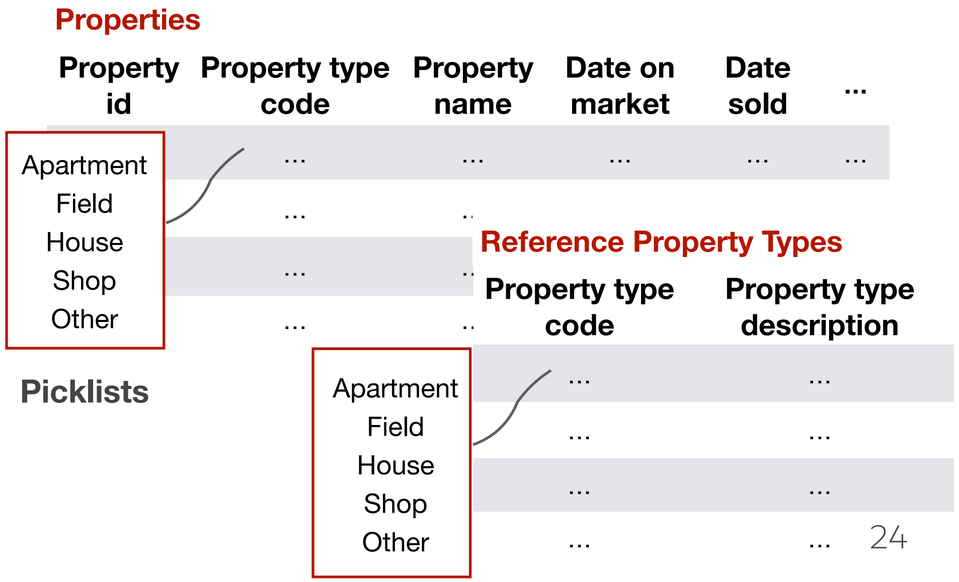
Observation 3: Most "rare entities" mentioned in the question correspond to tables, fields, or DB cells

Problem Setup

Question

Database Schema

Show names of properties that are either houses or apartments



Problem Setup

Research Question:

How can we learn a representation that effectively captures the language grounding of an input question, the DB schema and the DB content?

Question | Database Schema

Schema-Consistency Guided Decoding

Pruning the search space of a sequential pointer-generator decoder

- **Observation:** The FROM clauses set the scope of a SQL query and the table fields appeared in the rest of the clauses can only belong to the tables in FROM

```
SELECT T2.name FROM Instructor AS T1 JOIN Department AS T2 ON T1.Department_ID = T2.ID
GROUP BY T1.Department_ID HAVING AVG(T1.Rating) > (SELECT AVG(Rating) FROM Instructor)
```

Schema-Consistency Guided Decoding

Pruning the search space of a sequential pointer-generator decoder

- **Observation:** The FROM clauses set the scope of a SQL query and the table fields appeared in the rest of the clauses can only belong to the tables in FROM

```
SELECT T2.name FROM Instructor AS T1 JOIN Department AS T2 ON T1.Department_ID = T2.ID
GROUP BY T1.Department_ID HAVING AVG(T1.Rating) > (SELECT AVG(Rating) FROM Instructor)
```

Rewrite a SQL query in execution order, with FROM clause at the beginning of each sub-query

```
FROM Instructor AS T1 JOIN Department AS T2 ON T1.Department_ID = T2.ID SELECT T2.name
GROUP BY T1.Department_ID HAVING AVG(T1.Rating) > (FROM Instructor SELECT AVG(Rating))
```

Schema-Consistency Guided Decoding

Pruning the search space of a sequential pointer-generator decoder

- **Observation:** The FROM clauses set the scope of a SQL query and the table fields appeared in the rest of the clauses can only belong to the tables in FROM

```
SELECT T2.name FROM Instructor AS T1 JOIN Department AS T2 ON T1.Department_ID = T2.ID
GROUP BY T1.Department_ID HAVING AVG(T1.Rating) > (SELECT AVG(Rating) FROM Instructor)
```

Rewrite a SQL query in execution order, with FROM clause at the beginning of each sub-query

```
FROM Instructor AS T1 JOIN Department AS T2 ON T1.Department_ID = T2.ID SELECT T2.name
GROUP BY T1.Department_ID HAVING AVG(T1.Rating) > (FROM Instructor SELECT AVG(Rating))
```

Lemma: Let Y_{exec} be a SQL query with clauses arranged in execution order, then any table field in Y_{exec} will appear after the corresponding table token.

Schema-Consistency Guided Decoding

- Generate SQL queries in execution order and unmask DB fields dynamically

Schema-Consistency Guided Decoding

- Generate SQL queries in execution order and unmask DB fields dynamically

```
FROM
```

Schema-Consistency Guided Decoding

- Generate SQL queries in execution order and unmask DB fields dynamically

```
FROM Instructor
```

Schema-Consistency Guided Decoding

- Generate SQL queries in execution order and unmask DB fields dynamically

```
FROM Instructor JOIN
```

Schema-Consistency Guided Decoding

- Generate SQL queries in execution order and unmask DB fields dynamically

```
FROM Instructor JOIN Department
```

Schema-Consistency Guided Decoding

- Generate SQL queries in execution order and unmask DB fields dynamically

```
FROM Instructor JOIN Department ON
```

Schema-Consistency Guided Decoding

- Generate SQL queries in execution order and unmask DB fields dynamically

```
FROM Instructor JOIN Department ON Instructor.Department_ID = Department.ID SELECT
Department.name GROUP BY Instructor.Department_ID HAVING AVG(Instructor.Rating) >
(FROM Instructor SELECT AVG(Instructor.Rating))
```

Schema-Consistency Guided Decoding

- Generate SQL queries in execution order and unmask DB fields dynamically

```
FROM Instructor JOIN Department ON Instructor.Department_ID = Department.ID SELECT
Department.name GROUP BY Instructor.Department_ID HAVING AVG(Instructor.Rating) >
(FROM Instructor SELECT AVG(Instructor.Rating))
```

- ✓ Implemented via vector space computation
- ✓ Applied during inference only
- ✓ Cannot guarantee schema consistency, used in combination with static SQL correctness check
- ✓ Can be applied to other types of decoders

Dataset - Spider

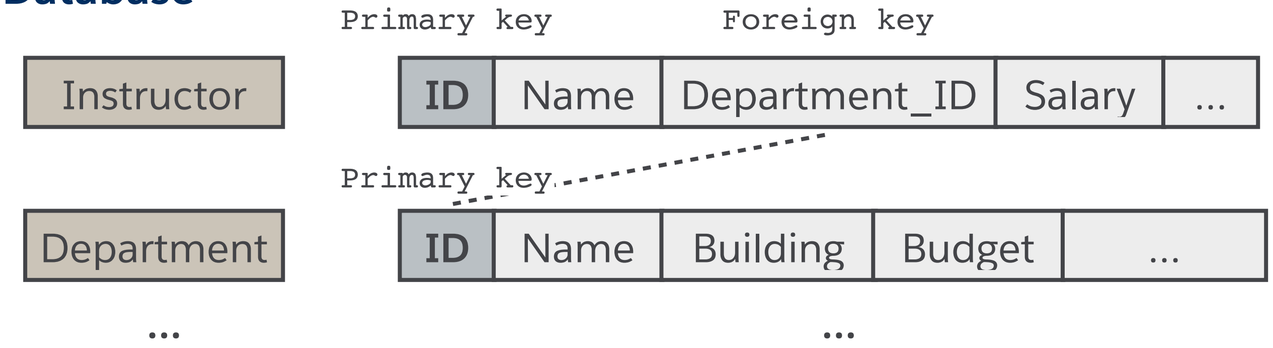
(Yu et al. 2018)

Expert-annotated, **cross-domain**, **complex** text-to-SQL dataset

No overlap between Train/Dev/Test databases, enabling the development of text-to-SQL models which generalize to unseen DBs

	Train	Dev	Hidden Test
# DBs	146	20	40
# Examples	8,659	1,034	2,147

Database



Question What are the name and budget of the departments with average instructor salary above the overall average?

SQL

```
SELECT T2.name, T2.budget
FROM Instructor AS T1 JOIN Department AS T2 ON
T1.Department_ID = T2.ID
GROUP BY T1.Department_ID
HAVING AVG(T1.salary) >
     (SELECT AVG(Salary) FROM Instructor)
```

Dataset - WikiSQL 

(Zhong et al. 2017)

Generated over **Wikipedia tables** using the **semantic-parsing-overnight** approach (Wang et al. 2015)

SQL Template:

```
SELECT $AGG $COLUMN
WHERE $COLUMN $OP $VALUE
(AND $COLUMN $OP $VALUE)*
```

Train/Dev/Test tables overlap, but **49.6%** of dev tables are not in the train set and **45.1%** of test tables are not in the train set.

	Train	Dev	Test
# Tables	17,984	1,621	2,787
# Examples	56,355	8,421	15,878

WikiTable

Player	No.	Nationality	Position	Years in Toronto	School/Club

Question Who is the player that wears number 45?

SQL

```
SELECT Player WHERE No. = 42
```

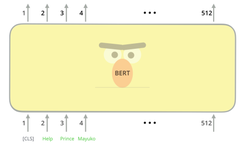
Experiment Setup

Pre-processing

- Compute fuzzy string match between the input question and the picklists of each DB field to obtain value mentions
- For each DB field, use the top-K matches in the DB schema representation ($K = 2$)

Decoding

- Beam search with length penalty
  - beam size = 16 for ablation study; beam size = 64 for leaderboard results



BERT-large-uncased, 24 layers (Devlin et al. 2019)

Evaluation

- Exact set match
  - Logical form match ignoring values and SQL component order invariance
- Execution accuracy
  - Check if the execution results of the predicted SQL query matches the executions results of the ground-truth SQL query

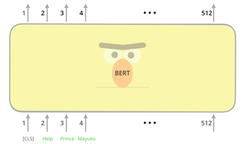
Experiment Setup

Pre-processing

- Compute fuzzy string match between the input question and the picklists of each DB field to obtain value mentions
- For each DB field, use the top-K matches in the DB schema representation ($K = 2$)

Decoding

- Beam search with length penalty
  - beam size = 16 for ablation study; beam size = 64 for leaderboard results



BERT-large-uncased, 24 layers (Devlin et al. 2019)

Evaluation

- Exact set match
  - Logical form match ignoring values and SQL component order invariance
- Execution accuracy
  - Check if the execution results of the predicted SQL query matches the executions results of the ground-truth SQL query

Better evaluation for text-to-SQL is still an open research problem

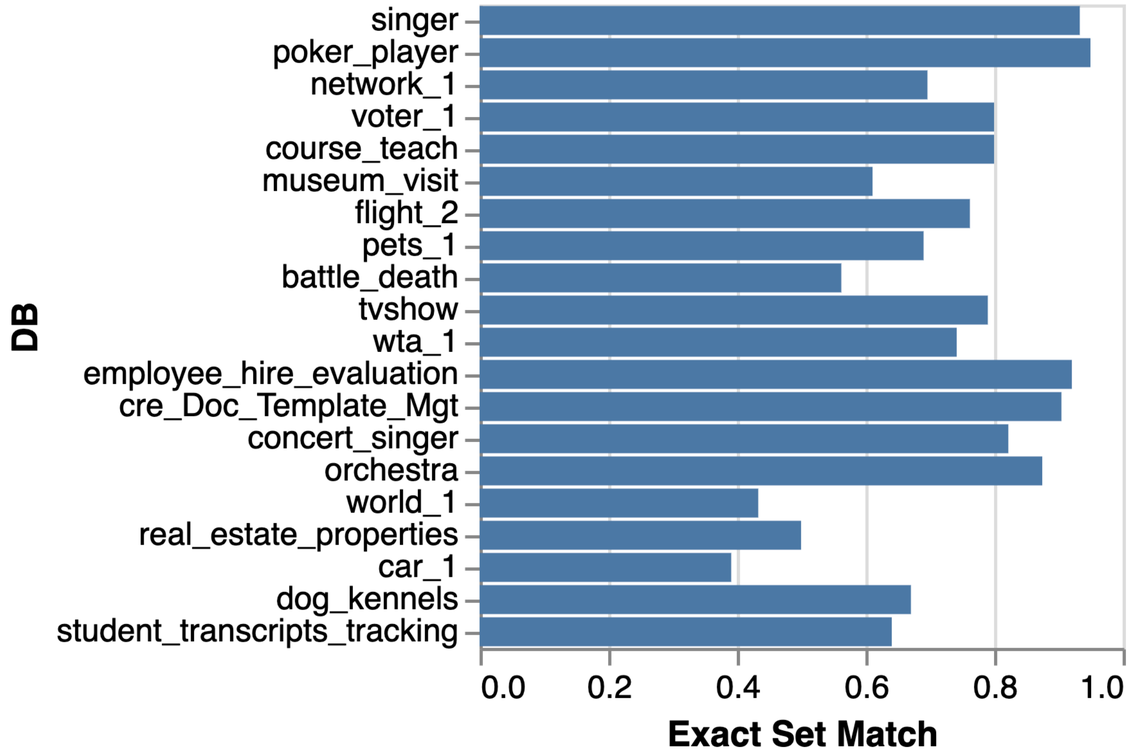
Top-3 model using execution guided decoding

Cross-Database Performance



Performance varies significantly w.r.t. different DBs

Figure 10. Performance of BRIDGE on each database on the Spider dev set.

Error Analysis

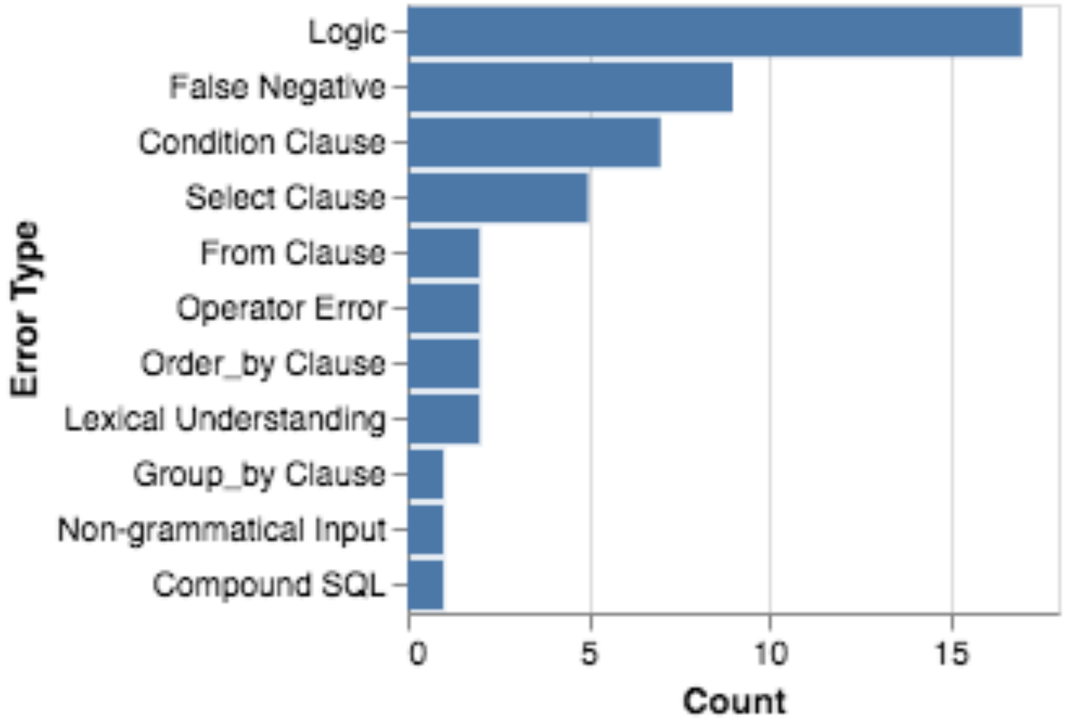


Figure 11. Manual error categorization for 50 wrong predictions on the Spider dev set.

Error Analysis

Error Analysis

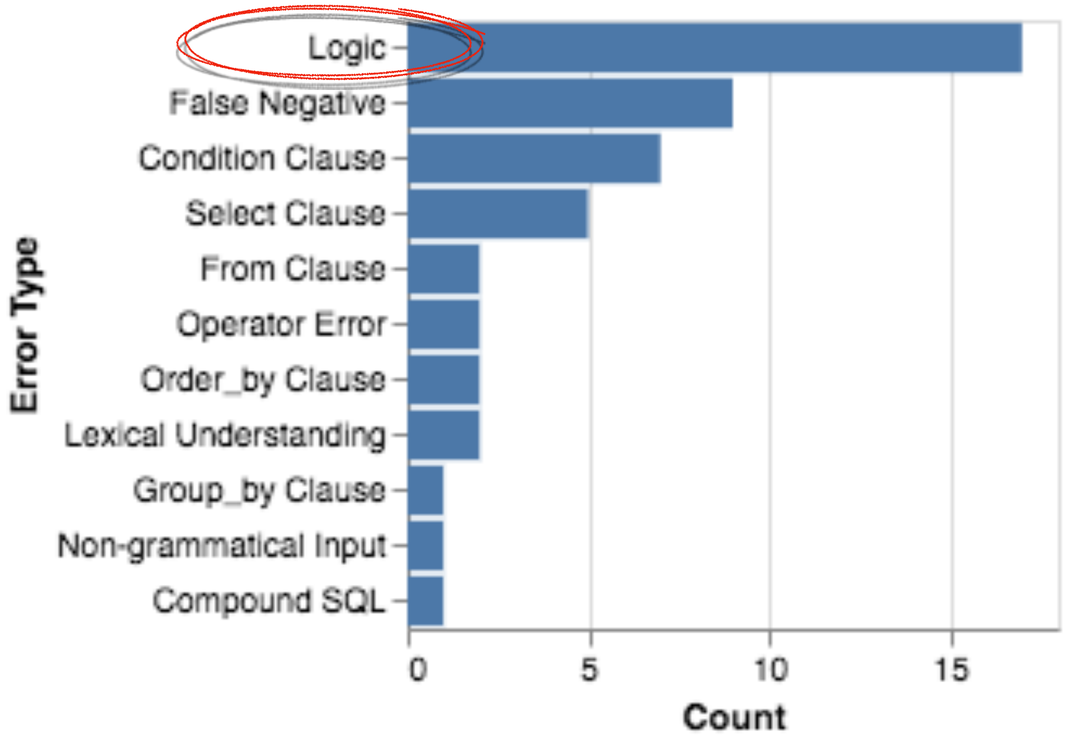

Figure 11. Manual error categorization for 50 wrong predictions on the Spider dev set.

Qualitative Examples

Error Category I - Logic

Logic

Find the number of concerts happened in the stadium with the highest capacity. **concert_singer**

✗
```
SELECT COUNT(*) FROM stadium JOIN concert ON stadium.Stadium_ID = concert.Stadium_-
ID ORDER BY stadium.Capacity DESC LIMIT 1
```

✓
```
SELECT COUNT(*) FROM concert WHERE stadium_id = (SELECT stadium_id FROM stadium
ORDER BY capacity DESC LIMIT 1)
```

Show the names of all of the high schooler Kyle's friends. **network_1**

✗
```
SELECT Highschooler.name FROM Friend JOIN Highschooler ON Friend.friend_id =
Highschooler.ID WHERE Highschooler.name = "Kyle"
```

✓
```
SELECT T3.name FROM Friend AS T1 JOIN Highschooler AS T2 ON T1.student_id = T2.id
JOIN Highschooler AS T3 ON T1.friend_id = T3.id WHERE T2.name = "Kyle"
```

Qualitative Examples

Error Category II - Lexical Understanding

Lexical Understanding

Count the number of countries for which Spanish is the predominantly spoken language.

world_1

✗
```
SELECT COUNT(*) FROM countrylanguage WHERE countrylanguage.Language = "Spanish"
```

✓
```
SELECT COUNT(*), MAX(Percentage) FROM countrylanguage WHERE LANGUAGE = "Spanish"
GROUP BY CountryCode
```

What are the full names of all left handed players, in order of birth date? WTA_1

✗
```
SELECT first_name, last_name FROM players ORDER BY birth_date
```

✓
```
SELECT first_name, last_name FROM players WHERE hand = 'L' ORDER BY birth_date
```

Qualitative Examples

Error Category III - Robustness

Robustness

What is the model of the car with the smallest amount of horsepower? **car_1**

✗
```
SELECT cars_data.Horsepower FROM cars_data ORDER BY cars_data.Horsepower LIMIT 1
```

✓
```
SELECT T1.Model FROM CAR_NAMES AS T1 JOIN CARS_DATA AS T2 ON T1.MakeId = T2.Id
ORDER BY T2.horsepower ASC LIMIT 1
```

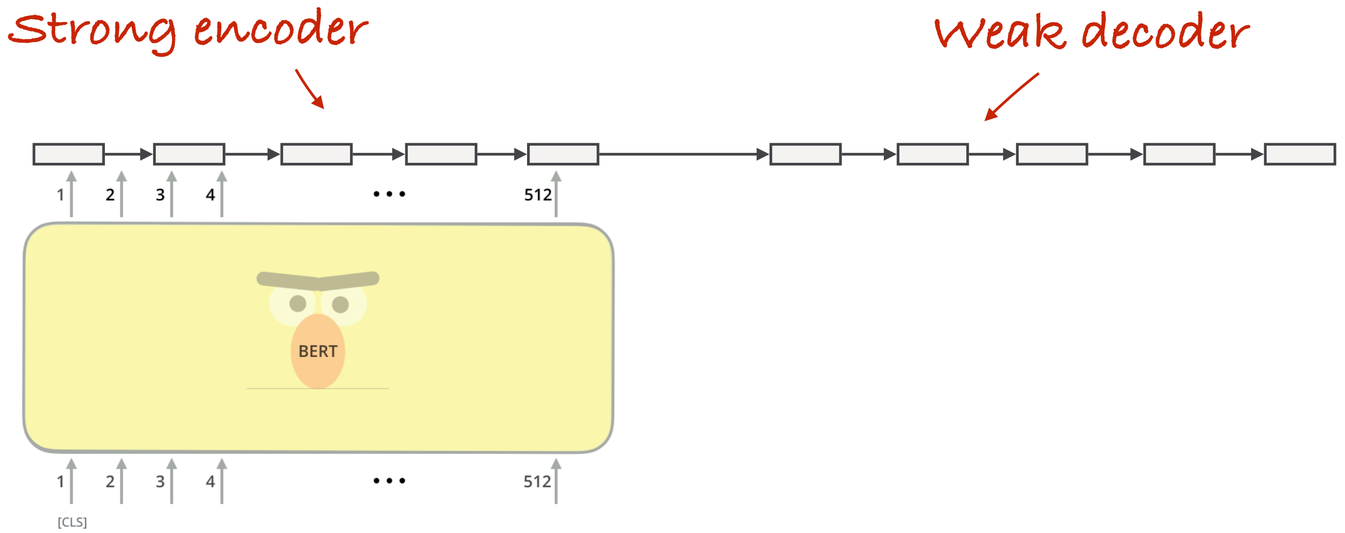
What is the total population and average area of countries in the continent of North America whose area is bigger than 3000? **concert_singer**

✗
```
SELECT SUM(country.Population), AVG(country.Population) FROM country WHERE
country.Continent = "North America" AND country.SurfaceArea  3000>
```

✓
```
SELECT SUM(country.population), AVG(country.surfacearea) FROM country WHERE
country.Continent = "north america" and country.SurfaceArea  3000>
```

Discussion

1. BRIDGE uses a sequential encoder for jointly encoding text, DB schema and relevant DB cells, and a sequential decoder for generating SQL queries. The decoder has significantly fewer parameters than the encoder.



LM Alternatives:

BART (Lewis et al. 2020)

T5 (Raffel et al. 2020)

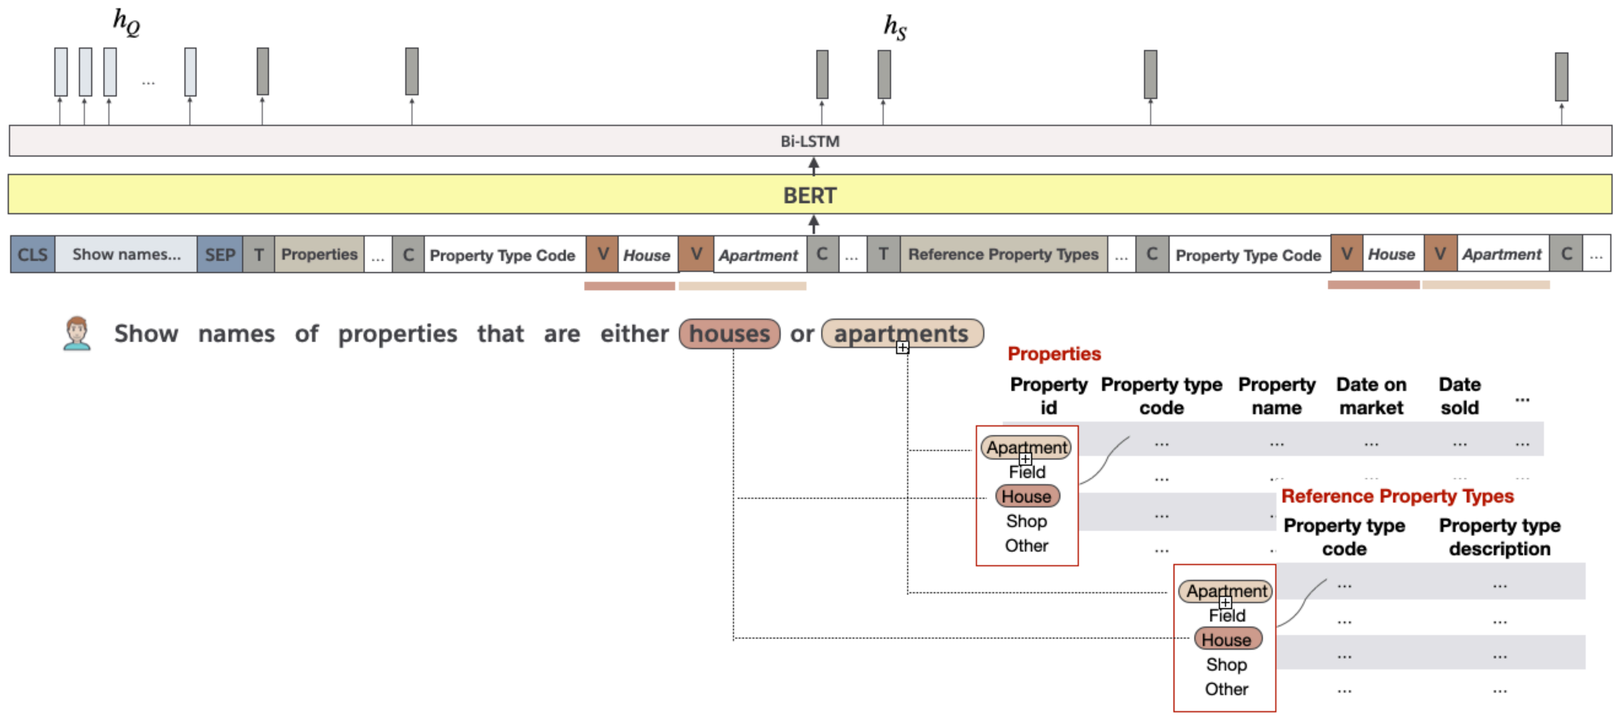
GPT-2 (Radford et al. 2019)

GPT-3 (Brown et al. 2020)

…

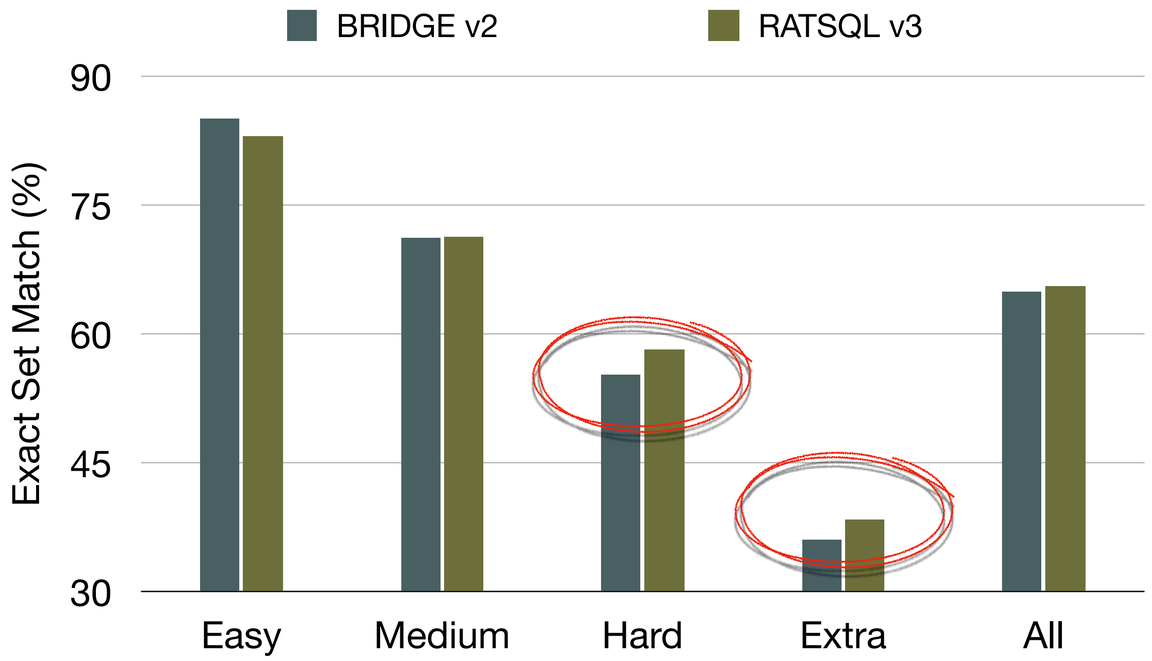
Discussion

II. Learning to recognize relevant cells (addressing acronyms and other lexical variations)



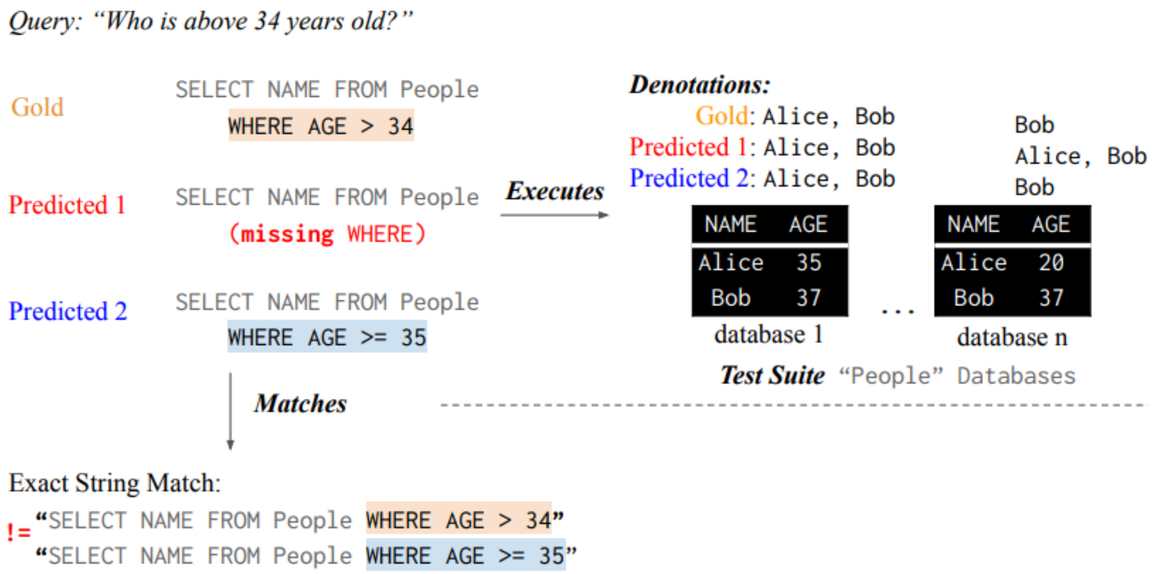
Discussion

III. Compositional inductive biases (CIBs) show significant benefit for synthesizing hard SQL queries. Previous work have shown that CIBs are effective for improving model's compositional generalization and overcoming data sparsity.



Discussion

IV. More comprehensive model evaluation and benchmarking.

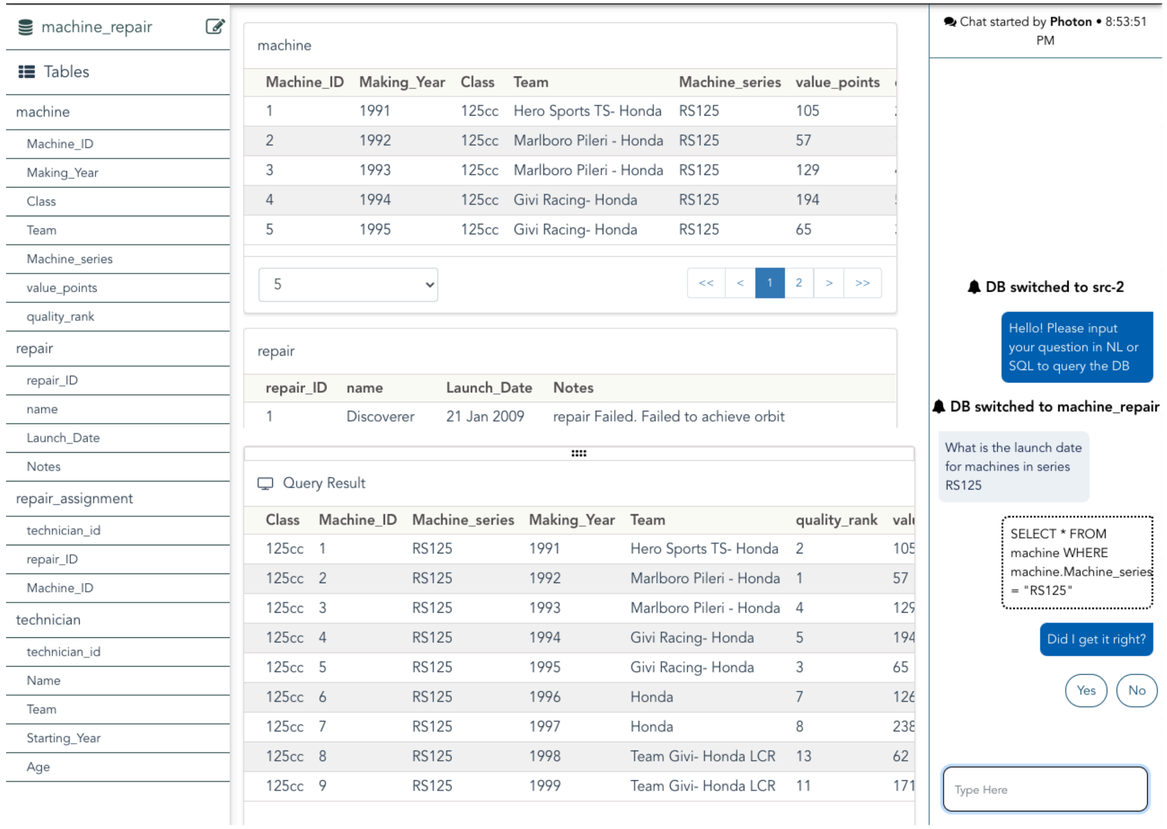


Distilled Test Suites by (Zhong et al. 2020)

Discussion

V. Existing benchmark datasets are not perfect.

- Sparse schema component coverage
- Sparse logic relation coverage
- Data synthesis?
- Interpolation?



Discussion

VI. More future directions

- Train with execution feedback
- Overcome data sparsity
- Interpretability and Explainability
- Process context and pragmatics
- Question answering over DBs, documents, and other modality of information
- …

https://github.com/salesforce/TabularSemanticParsing

Star 51 Fork 11

Pre-trained transformer LMs can effectively capture language-database grounding when the cross-modal data are serialized and tagged with special tokens

Two strategies significantly contribute to the overall text-to-SQL performance

- The bridging mechanism that appends field values mentions (anchor texts) to the corresponding field names in the serialized representation
- Search-space pruning based on SQL syntax and schema consistency
